# The Katterra Story

Founded in 2015, Katterra is on a mission to help transform construction through technology – every process and product.

Katterra is a new kind of company in the building and construction industry, delivering a comprehensive suite of products and services for our clients. This offering is possible because of Katterra's distinct model which combines end-to-end integration with significant investment in technological and design innovation.

The building industry is vital to the environment and the social fabric of our communities. We have an opportunity within the next decade to develop new solutions the right way, solutions that not only ramp industry productivity, but also drastically reduce the carbon footprint of construction and provide relief for housing shortage and affordability.

With over 300 projects in the pipeline, Katterra is putting modern technology to work at all levels of building design and construction to help address some of the industry's most entrenched challenges. By integrating traditionally fragmented steps in the design-build process, Katterra's end-to-end model offers a unique value proposition: a fully integrated partner with robust technology systems.

Katterra's goal is to develop the most advanced mass timber building systems in the world, and to make them more widely available, more efficiently produced, and of higher quality than ever before. By highlighting a number of our product offerings, I will explore how Cross-laminated timber (CLT) is fundamentally changing the way we design, manufacture, and build. Katterra's investments and innovations will help CLT become the backbone for future generations of high-performance, low-carbon buildings.
