Auditorium of Rome

Glulam roof structures: design and erection

In the very heart of Rome the "Citta' della musica" has finally been completed; After three years 3 halls-auditoriums- , 2700-1200 and 750 , so named after the total seats capacity, the majestic construction by Italian maestro Arch. Renzo Piano is now fully available to the international shows.

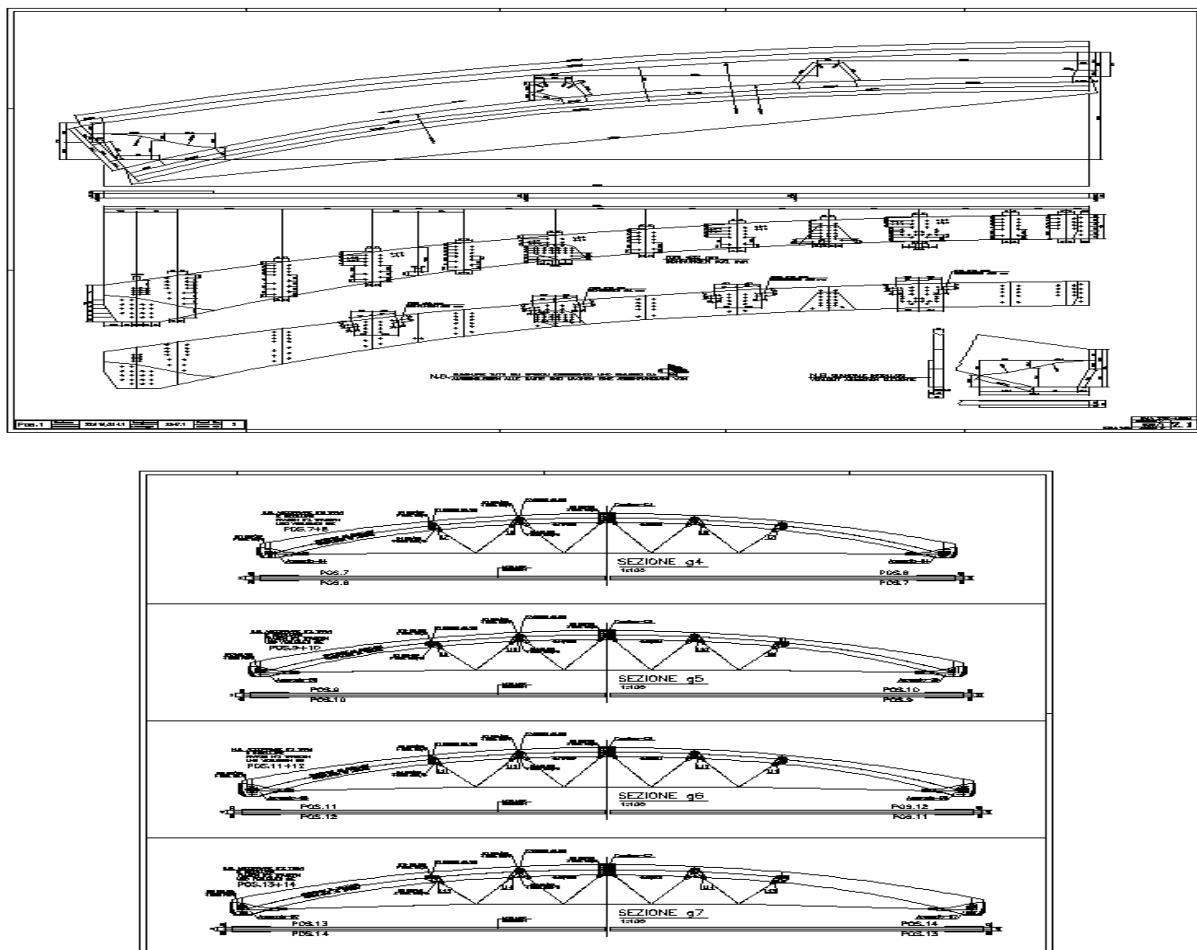

The following presentation-mainly pictures taken during construction- is aimed to show the design and erection process which has been carried out under my direction on behalf of KAUFMANN HOLZ AG of Austria.

Total time for erection has
been six months:

1500 mc GLULAM,
1.000.000 kg steel
9000 sqm of panels

Sample of production drawings

Unloading half-arches : max tot weight: kg. 14.700 hall 2700 type G10-G11.

Storing area of steel and glulam materials

End connections of steel members of main trusses

Steel parts to be inserted on ground before erection

Detail of lower hinge ;
each weighing kg. 3300
(hall 2700)

Top hinge: kg. 1080 (hall 2700)

Connecting steel parts: hinges, steel chords, windbracing, ...

in order to assemble the whole truss a temporary tower has been used: the total weight of half truss being kg. 27000 (beam G11)

Two half beams, before erection

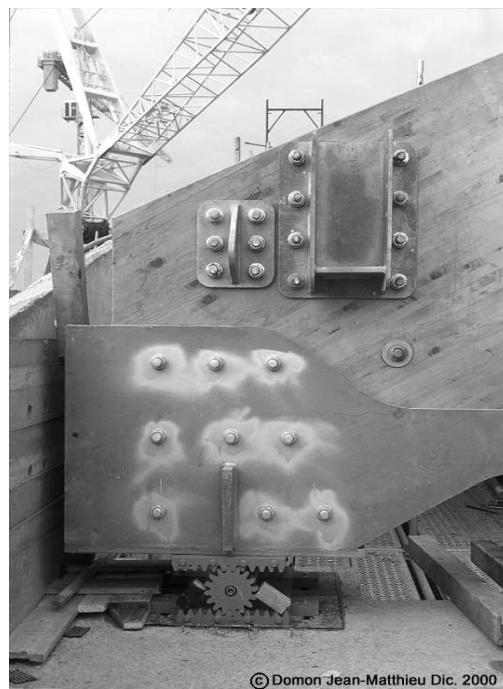

Assembling the twin traction rods: diameter 100mm (hall 2700)

The towers used to assemble
the truss can be adjusted with
hydraulic jigs
(not showed)

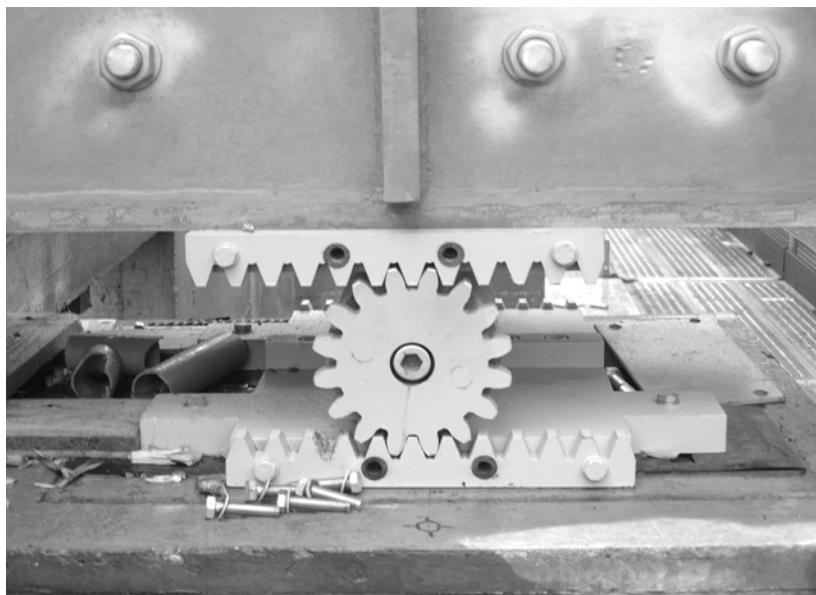

(hall 1200)

The lower hinge (slide) is temporarily stopped during erection

Top hinge

© Domon Jean-Matthieu Nov 2001

The 18 trusses of hall 2700 are lifted with a 400 TONS crane

© Domon Jean-Mathieu Set 2001

Scaffolding itself is a powerful structure !

The connection of tension rods can be adjusted with a Freyssinet hydraulic muffle

Glulam Wind bracing

Side construction has made of curved arches supported by steel tubes

250 mc glulam e 150.000 kg steel

Siding is made of 3D curved panels K1 MULTIPLAN 5 layers in larch mm 60.
