# **Effective applications of Engineered Wood Products in non-residential construction**

Recent years have seen many North American non-residential projects include a number of the relatively new structural wood components known as Engineered Wood Products. This has changed the manner in which such work is planned and executed, as well as expanding the potential for use of wood in buildings often constructed in steel or concrete. The paper will examine the changes in approach to building design, and some examples of projects which have successfully incorporated several of these components as an integrated system.
